How does a shale well work?

Water, a small amount of chemicals, sand and other proppant are pumped into the wellbore under extremely high pressure. When the mixture reaches the target zone the pressure forces it out through the perforations and into the low permeable shale causing it to fracture or crack. This creates a fairway connecting the reservoir to the well.

How is a surface casing drilled?

The hole for the surface casing is then drilled. A drill bit is mounted on the end of the drill pipe as the bit grinds away a mixture of water and additives called 'Mud' is pumped into the hole to cool the bit and flush the cuttings to the surface. The pipe and bit are then removed and surface casing is inserted into the hole.
