How do you Grout a HDD borehole?

Pressure grouting through sleeve pipes installed inside HDD boreholes. Procedure of drilling a hole to full depth in one operation and grouting from the bottom of the hole towards the surface in successive stages by setting a single packer at predetermined depths. Grouting stage 3 (...)

How difficult is it to grout diamond drill holes?

Grouting diamond drill holes can be challenging. If you are manually grouting in the presence of water, the grout delivery line really needs to go to the toe of the hole to displace the water and hopefully the grout won't get washed away. This is time consuming and difficult, and with only a marginal chance of success.

What is the history of down-the-hole drilling?

The state of practice for overburden drilling techniques was most recently described by Bruce in 2012, and the history of Down-the-Hole (DTH) drilling for rock was provided by the authors in 2013 (Bruce et al., 2013).

How deep do geotechnical holes need to be drilled?

The specialty geotechnical construction processes of grouting, anchoring, micropiling, soil nailing and ground freezing all require the drilling of holes through overburden and/or rock. Such holes typically are 3 inches to 12 inches in diameter and are rarely more than 200 feet deep.

What RPM does down-the-hole drilling work?

Down-the-hole drilling is performed at approximately 10 rpm to 60 rpm in hole diameters above 3 1/2 inches to depths of over 300 feet. Since the percussive effect is applied immediately above the bit, regardless of depth of hole, penetration rate is constant with depth, other factors being equal.

Why do we need oversized drill bits for interlocked pipe walls?

Overdrilling or air escaping, which could otherwise cause settlements to existing structures. Improved drilling tools, along with the increasing utilization of DTH in construction markets, have resulted in the innovation of using special connection elements and oversized drill bits to construct interlocked pipe walls.
