What does G80 mean in machining?

G80 is the code used to cancel all active canned cycles. Canned cycles are sometimes referred to as fixed cycles and they are used for a variety of common machining tasks such as drilling or threading holes. What are canned cycles?

What does the G80 CNC code do?

G80 is the code used to cancel all active canned cycles. Canned cycles are sometimes referred to as fixed cycles and they are used for a variety of common machining tasks such as drilling or threading holes.

What is a G81 G89 drill cycle?

Commonly used cycles are G81 to G89. Drills to depth Z at feedrate F, retracts to R-plane. Used with rigid tapping (requires spindle orientation and reverse). No dwell or pause; bores in and retracts smoothly. Advanced boring cycles, each with unique retract/feed strategies (mostly Fanuc/Siemens).

What does the G80 code do?

The G80 code is used to turn off canned cycles. Once you have drilled all the holes you need or threaded all the holes required, the G80 code can be used to stop drilling or threading. If the G80 code is not used, once the machine is given a new location it will attempt to run the active canned cycle again at the new location.

What is the difference between G81 and G82 drills?

G82 is like G81 but adds a short dwell time at the bottom to allow cleaner hole finish or chip evacuation. Peck drilling is used for deeper holes, breaking the cut into multiple steps to clear chips and reduce tool pressure. This drills 3 deep holes in peck cycles. Each peck is 5mm until it reaches -20mm.

Our powerful drills hit harder and penetrate rock faster than any other drill on the market. Many companies have copied our S83 name but if you want the best you need to buy a true BTE ...
