What are core drilling sizes?

Core drilling sizes refer to the diameter of the drill bit and the diameter of the recovered rock core. In diamond drilling, bits are designed to cut through hard rock while preserving a solid cylindrical sample from the centre. These samples are then used for geological logging, structural analysis, and laboratory testing. Each bit has:

Why is core drilling important?

Core drilling provides critical geological samples used to assess mineral deposits and inform future mining operations. Selecting the appropriate core drilling size is essential to balance cost-efficiency, sample quality, and geological suitability.

What size spindle do you use on a drill motor?

with 7 threads per inch. Industry standard on bits 1-5/8" and up. 1.250"-7 spindle is found on most drill motors. 5/8" opening with 11 threads per inch. Used on small diameter bits and dry hole saw bits. Typically for hand-held applications. 1-1/4" opening with 12 threads per inch. Special hub

How do you find the optimum ROP for a diamond drill?

Finding the optimum ROP for a given rock type, rock condition, bit and model of diamond drill is the goal of the professional diamond driller. Once found, this ideal ROP is maintained by adjusting the WOB and RPM. A high water flow across the bit face should always be maintained at high rates of penetration.

What is the difference between hole size and core size?

Each bit has: Hole (outer) diameter: The width of the hole drilled into the ground. Core (inner) diameter: The size of the core sample retrieved. The industry standard sizes are categorised into a system known as the Q-series, ranging from AQ (smallest) to PQ (largest).

Are there absolute parameters for the application of drilling tools?

As drilling conditions and the capabilities of drilling equipment vary considerably from site to site, it is impossible to define absolute parameters for the application of our drilling tools.

Core drilling is more precise and allows for greater control over the size and shape of the hole being drilled than traditional drilling. Additionally, ...

Core hole sizes in oil and gas well drilling vary depending on the formation and application. The most common core hole sizes are 1.5, 2, 2.5, and 3 inches.

Rock Quality Designation (RQD) The RQD is a modified core recovery. Measure of the degree of fractures, joints, and discontinuities of rock mass RQD sum of pieces \geq 100 mm (4 inches) ...

P38Z Very High Diamond Concentration (Premium Grade) for Longer Life Drilling in Hard Aggregate with Reinforcement (38 Bond) with Small Diamond Size (Z) for Faster Drilling.

Diamond core drilling uses a diamond bit, which rotates at the end of drill rod (or pipe) (Figure 16 - 1). The opening at the end of the diamond bit allows a solid column of rock to move up into ...

The P4(TM) dry core bit was designed for core drilling a wide range of hard materials using a standard drill. The diamond bond and turbo rim design of the P4(TM) was formulated to cut ...
