How to adjust air compressor cut-in pressure?

First of all, turn off your air compressor. To adjust the cut-in pressure, turn the big set screw on the pressure switch clockwise to increase the pressure and anti-clockwise to decrease the pressure. Now, adjust the differential pressure switch to change the cut-out pressure.

How do you adjust air compressor pressure?

You should maintain a pressure differential of at least 20 PSI between the cut-in and cut-out pressures. Run your compressor until it reaches the cut-out pressure and ensure it is doing so successfully. This procedure may vary depending on your air compressor pressure switch type. Some pressure switches can only be adjusted when under pressure.

How to regulate the pressure of a compressor?

Here is a step-by-step instruction to regulate the pressure of the compressor. There are two types of adjusting to choose from that depend on the model of the pressure switch. You can adjust only the pressure setting, with a fixed differential pressure, or you can adjust both the pressure setting and the differential pressure.

Can a compressor pressure switch be adjusted?

compressor pressure switch type. Some pressure switches can only be adjusted when under pressure. Don't turn any of the screws when there is zero pressure in the tank, or when you just get your new pressure switch out of the box. Always check the manual, just to be sure.

What is a good pressure differential for a compressor?

A rule of thumb is that the pressure differential of at least 1 bar (14 psi). If the difference between the cut-in pressure and the cut-out pressure is set too small, the compressor will quickly start and stop repeatedly. This will burn the compressor motor, will cause extra wear on the compressor components and will damage the pressure switch.

How much pressure should a compressed air compressor have?

You set the minimum pressure on the pressure switch at 6 bar (or 6.1 to be sure) and you set the maximum pressure at 7.1 bar. Now you always have an high enough pressure in your compressed air system, and you made sure that the compressor stays healthy by not having it start and stop all the time. Cut-in pressure is 6.1 bar.
