What is a rotary screw air compressor?

A rotary screw air compressor is one of the two types of positive displacement gas compressors. It uses two rotors to create the pressure needed for air compression. They are one of the easiest types of air compressors to use and maintain. The other type of positive displacement compressor is the reciprocating or piston compressor.

How does a screw compressor work?

A screw compressor can run loaded ('pumping air') or unloaded ('idle'). The inlet/loading valve opens and closes according to air demand. The inlet valve is controlled by a solenoid valve that supplies control air to the inlet/loading valve. Check solenoid valve coil and solenoid valve operation.

How do oil-free screw compressors work?

This is why oil-free screw compressors frequently work in several stages and interstage cooling to reach higher pressures. One variant is known as an oil-flooded compressor or an oil-injected compressor. The technical name, however, is oil-lubricated. Oil-lubricated rotary screw compressors inject oil into the compression chamber.

Are screw compressors oil-free?

Consequently, the compressed air is completely oil-free. The built-in pressure ratio is limited by the limiting temperature difference between the inlet and the discharge. This is why oil-free screw compressors frequently work in several stages and interstage cooling to reach higher pressures.

What is oil lubricated rotary screw compressor?

The technical name, however, is oil-lubricated. Oil-lubricated rotary screw compressors inject oil into the compression chamber. This oil cools and lubricates the compressor element, helping remove heat while minimizing leakage in the compression chamber. Oil-lubricated screw compressor elements can be manufactured for high-pressure ratios.

What should I do if my air compressor is too low?

If the capacity of the air compressor is really too low, check the following: Check differential pressure over oil separator. Replace separator when necessary. Check and replace compressed air filters (if installed). Compressor does not unload. Check if pressure switch is correctly set and working.
