

How to set up the oil-injected screw air compressor

How does an oil injected air compressor work?

Many components comprise an air compressor, but the system's heart is the air end, where air is compressed. An oil-injected air end looks like this: Air enters the air end through an inlet valve, where it is mixed with oil while being compressed. The oil is later separated from the compressed air, before it exits the system.

How does a screw compressor work?

The screw compressor element When the inlet/unloader valve is open, the air enters the compressor screw element. The screw element works like a pump and it compressed the air. During this process, oil is injected in the element. The oil is there to cool the air, as the air gets very hot during compression.

Why do rotary screw air compressors need oil?

Oil is a critical component of an oil-injected rotary screw air compressor, performing many important jobs at once. Oil lubricates the system, protects components from wear, keeps the system cool, and helps trap and remove contaminants.

How do you separate oil from air in a compressor?

Compressed air/oil mixture This mixture leaves the screw element through a one-way valve. This valve makes sure that the oil cannot flow back into the compressor element through the exit pipe (this could happen when the compressor stops). The oil separator Now we need to separate the oil and the air. This is done in the separator tank.

How much oil do you put in a air compressor?

Open valve (7) and drain approximately 0.2 l (0.05 US gal / 0.04 Imp gal) of oil into a clean receptacle. Carefully pour this oil through the filter housing into the compressor element. Fit the air filter and screw on the filter cover. Refit the top and front panels. Check the oil level.

How does compressed air & compressor oil work?

Now we have a mixture of compressed air and compressor oil. Compressed air/oil mixture This mixture leaves the screw element through a one-way valve. This valve makes sure that the oil cannot flow back into the compressor element through the exit pipe (this could happen when the compressor stops).
