MINE TYPES Drill Types and Technology Drill Types Hammer Technology Top Hammer Blasthole Drilling Down the Hole Drilling Rotary Drilling Rotary drilling is a versatile method for blasthole drilling.

What makes a good drilling & blasting practice?

Driller inexperience. Good drilling and blasting practices start with the accurate layout and drilling of blastholes in planned - and sometimes unplanned - locations. The location of blastholes to be drilled for a single blast rarely form a uniform, rectangular grid.

Is down the hole drilling safe?

Thankfully, we live in the modern era, where down the hole (DTH) drilling has become one of the most efficient and safest methods since its invention in the mid 1950s. Let's explore what DTH drilling is, why it's such a successful technique, and how it might be the perfect process for your drilling operation.

What is a blast hole used for?

Blast hole drilling: Commonly used for drilling blast holes in mining and quarrying operations, as well as in road and tunnel construction. Anchoring: Applied for creating anchor holes in slope stabilization projects and retaining structures. Rock socketing: Used in dam and bridge construction to drill into rock for securing foundation supports.

What is the difference between rotary drilling and blasthole drilling?

In rotary drilling, no blow is struck, and the rock is made to fail by a combination of down pressure and rotation speed. In blasthole work, the cuttings are flushed from the hole by compressed air, but consideration here is more toward providing enough volume to maintain a suitable bailing velocity rather than pressure.

Why is drilling & blasting important?
