

Injection of oil into the exhaust pipe of an internal combustion rock drill

How do I choose a fuel injection pump piping system?

Where fuel injection pumps are fitted, particular attention is to be given to the fuel injection pump supply and spill line piping which may be subject to high-pressure pulses from the pump. Connections on such piping systems should be chosen to minimise the risk of pressurised fuel oil leaks.

How does a fuel injection system work?

Injection forces fuel into the engine combustion chambers. There are several basic configurations of gasoline fuel injection, and throttle body. 2.1.0 Timed Fuel Injection System Timed fuel injection systems for gasoline engines inject a measured amount of fuel in timed bursts through

What is a rock drill used for?

It can adapt to these outside situations there is no water and no electronic power. It is a kind hand held drill built up with gasoline engine, air pump, rock drill and the rotation plum bum equipment for running or stop. It can be used as a tool for breaking, percussive drilling, tamping besides rock.

How does an EFI squirt fuel into the intake manifold?

squirting fuel into the intake manifold under pressure. The air induction system for the EFI typically consists of a throttle valve, sensors, an air filter, and connecting ducts. The throttle valve regulates how much air flows into the engine. In turn, it controls engine power output. Like the carb

How does a diesel engine injector work?

engines injectors squirt fuel into the intake manifold. In diesel engines, fuel is delivered directly into the combustion chamber. Spring pressure closes the Figure 4-5-- Fuel injector when the solenoid is deactivated. 1.6.0 Air Cleaner Air cleaners are used to prevent foreign matter, such as sand, dust,

How does an air injection system work?

exhaust gases from entering the air injection system. Basic operation of the air injection system is as follows: When the engine is running, the spinning vanes of the air pump force air into the diverter valve. If the engine is not decelerating, the air is forced through the diverter valve, the check valve, the air injection manifold, and into
