What are the components of a rock drill?

A rock drill consists of three main parts: the drill bit, which is the tip that makes contact with the ground during boring operations; the drill stem, which is the long frame that penetrates the ground and houses the drill bit; and the drill rod, which is the hollow part of the drill stem that connects the motor of the rig to the drill bit.

What makes a good drill bit?

Abrasion Resistance: Highly abrasive rocks can wear down drill bits quickly. Choosing a bit designed for high abrasion resistance can significantly extend its lifespan. Bit Type: Different bit types work better in certain situations and with certain rock types.

What is a rock drill bit made of?

It is typically made of tungsten carbide, which is known for its hardness and abrasion resistance. The shape and size of the drill bit can vary depending on the specific application, but its primary function is to create a hole by breaking and chipping away at the rock. Piston: The piston is a crucial component of the rock drill's engine.
