How does good drilling work?

Good drilling means that the entire system, from rock drill to drill steel to the rock itself, must harmonise. Here's how it works. Percussive drilling breaks the rock by hammering impacts transferred from the rock drill to the drill bit at the bottom of the hole.

What are drilling parameters?

Drilling parameters play a large role in helping drillers achieve superior drilling performance and long equipment life. They are basic recommendations that help guide a driller avoid burning core bits or damaging other drilling equipment, and help achieve a good rate of penetration and core recovery.

What factors affect drilling parameters?

There is a clear relationship between the drilling parameters and all other factors in drilling, such as the diameter of the equipment you're using, rock hardness or ground variability. We have seen that when drilling conditions change, drillers will adjust their drilling parameters.

How can I improve my drilling performance?

You can always make adjustments as you go in order to get your best drilling performance. In the drilling industry, the rate of penetration (ROP) is the speed at which a drill bit advances through the rock under it to deepen the borehole.

Why do you need a hydraulic drilling system?

The first is to provide hydraulic drilling that helps you exceed your production targets in a safe way. Thanks to the hydraulic system you don't have to worry about losing production time due to poor air pressure at large depths. We have also gone out of our way to design a system that helps you avoid heavy lifting and wasting precious energy.

Is a hydraulic drill better than a pneumatic drill?

The hydraulic system has an increased drill rate compared to electrical systems, and is considerably more energy efficient than pneumatic drills. And it saves your hearing as well. Perceived noise is about 50 percent lower than that of a pneumatic drill. five-step water adjustment to help you use the right amount of water for each step.
