

Reverse down-the-hole drill video explanation

What is reverse circulation drilling?

Unlike traditional drilling methods, reverse circulation drilling involves pumping high-pressure air or water down the drill string, which creates a reverse flow of fluid and cuttings to the surface. This technique not only allows for faster drilling speeds but also provides an efficient means of collecting large quantities of samples for analysis.

Why should you use a downhole hammer in reverse circulation drilling?

The downhole hammer used in reverse circulation drilling is capable of delivering a higher frequency of blows per minute, resulting in faster penetration rates and reduced drilling time. This increased efficiency can be particularly beneficial in large-scale mining and exploration projects, where time and cost considerations are critical.

How does a reverse circulation drill bit work?

The reverse circulation drill bit operates by creating a high-pressure air flow that is directed downwards into the hole. This air flow is created by a compressor, which pumps air into the drill pipe at a high velocity. The air is then forced through the drill bit and into the hole, creating a powerful cyclonic effect.
