How does a screw air compressor work?

Screw air compressor is divided into air cooling type and water cooling type, through the fan or water forcing cooling. Air cooling system consists of cooling fan, oil coolers and air cooler. The cooled air is pumped into the fan; go through oil cooler and air cooler, and at the same time, cool and compressing lubricating oil and air.

What are the components of screw air compressor?

Screw air compressor is the main components of screw head, the separation of oil and gas cylinder. Screw suction filter through the nose and suction inlet control valve, oil also inject compressed room, a cooling of the nose, while the screw and the bearings lubricated by compressed air pressure that is generated.

What happens when air compressor pressure drops?

When the pipeline pressure dropped to set the load pressure, the air compressor return to the loading state. Electromagnetic valve power, the intake valve open, the pressure increased. Based on the needs of compressed air, repeat cycle of the process.
