How does a shale well work?

Water, a small amount of chemicals, sand and other proppant are pumped into the wellbore under extremely high pressure. When the mixture reaches the target zone the pressure forces it out through the perforations and into the low permeable shale causing it to fracture or crack. This creates a fracture connecting the reservoir to the well.

What happens after a rig is erected?

After the rig is erected equipment is moved onto the rig floor, assembled and connected to power sources or pressurized piping systems. Some operators utilize an alternative method of managing returned fluids and solids called 'A Closed Loop System' which may reduce or eliminate the need for reserved pits.
