

The screw bearing of the air compressor is broken

What happens if a screw air compressor malfunctions?

Therefore, any malfunction in a screw air compressor not only disrupts production rhythms but may also lead to safety issues and economic losses. Thus, an in-depth study of common faults and their solutions is crucial for ensuring the stability and efficiency of industrial production.

How does a screw compressor work?

A screw compressor can run loaded ('pumping air') or unloaded ('idle'). The inlet/loading valve opens and closes according to air demand. The inlet valve is controlled by a solenoid valve that supplies control air to the inlet/loading valve. Check solenoid valve coil and solenoid valve operation.

What are common faults in screw air compressors?

Common faults in screw air compressors include difficulty in starting, automatic shutdown, abnormal vibrations, and temperature anomalies. The main causes involve improper slide valve positioning, component wear, insufficient voltage, pipeline vibrations, and inadequate oil levels.

Why is my air compressor not working?

Different applications require a specific amount of pressure to power a tool or complete a task. If your air compressor isn't building enough pressure, it won't be able to keep up. Here are some things to look for: Is there a leak in the hose or piping? It's crucial to adhere to fundamental safety precautions when troubleshooting.

Why does my compressor trip on over temperature?

If your compressor trips on over temperature, it could be any of the following: Ambient temperature too high or not enough ventilation. A screw compressor can run loaded ('pumping air') or unloaded ('idle'). The inlet/loading valve opens and closes according to air demand.

What happens if an air compressor breaks down?

When an air compressor breaks down, productivity may decline or stop altogether. Fortunately, there are things you can check on your own to decide if you have a serious compressor problem or something that can be fixed quickly. It's important to remember when troubleshooting to always follow safety SOPs and wear necessary protective equipment.
