How does good drilling work?

Good drilling means that the entire system, from rock drill to drill steel to the rock itself, must harmonise. Here's how it works. Percussive drilling breaks the rock by hammering impacts transferred from the rock drill to the drill bit at the bottom of the hole.

Do you need a rock drill?

You need a rock drill that lets you focus on drilling accurate blow and support holes. Fast and safe. The RD100 has a soft start function that is easy to reach with one hand. This means you can work with more precision, and collaring is made especially easy.

How do drilling contracts work?

This information is generally provided through the Regional Geotechnical Section. However, there are occasions when additional assistance is necessary. At those times, drilling contracts are let to procure the services of companies experienced in obtaining subsurface information, soil and rock samples, for geotechnical engineering purposes.

What should a geologist do when a drill rig shuts down?

Wherever the rig shuts down; record the time, reason and depth; give the time when drilling starts again (date, if necessary). Any other information, which the geologist feels, could directly effect either the completion of the drill hole to T.D. or the interpretation of data from and related to the drill hole. A= . How are drill rig samples Paid?

Driven split barrel samples and thin-walled tube samples are paid on an each basis. Rock core of various sizes is paid by the linear foot (meter). We pay the contractor to mobilize the drill rigs whether on land, or water (floating) or on water using a stationary platform (typically, a jackup barge).

How does a drill drill work?

The "blows" to the rock downhole are delivered by the bit, while a rotational device ensures that the bit impacts a new rock surface with each blow. A feed force is applied to maintain rock/bit contact. Compressed air is used to remove or "flush" the drill cutting from the hole, thereby advancing the hole depth at an efficient rate.
