What should I do when drilling a hole in a pipe?

o Reciprocate and work pipe while cleaning the hole. Ensure that you can work pipe with full stand or joint while circulating. o Condition mud prior to drilling ahead because if you still drill with poor mud properties, the differential sticking will be re-occurred.

How long does it take to drill a well?

Bookmark the permalink. Working in the oil field and loving to share knowledge. This is one of excellent training video demonstrating the drilling process from start at surface casing to completing of the well in less than 7 minutes. This would be a good tool to teach people about drilling in our oil and gas industry.

How do you fix a stuck pipe?

o Apply maximum flow rate as much as you can. o Apply maximum torque in the drillstring and work down torque to stuck depth. Torque in the string will improve chance of free the pipe. o Slack off weight of string to maximum sit down weight. o Jar down with maximum trip load. Torque may be applied with jarring down with caution.

What happens after a well is drilled?

Full Video Transcription Once the surface section of the well is drilled, the drill pipe is pulled out of the hole in order to lay the casing. This is done for environmental reasons to hydraulically seal the formation layers containing aquifers from the flowing hydrocarbons later on once the well is completed.

How do you drill a aquifer?

Once the cement has dried, the seal of the aquifers would be established. The drilling then continues through the wiper plug, the casing shoe and the cement at the bottom of the hole until the desired depth is reached. This is called total depth or TD and is where the pay zone is anticipated.

How do you free a pipe with jarring down?

Torque in the string will improve chance of free the pipe. o Slack off weight of string to maximum sit down weight. o Jar down with maximum trip load. Torque may be applied with jarring down with caution. The chance of freeing the pipe by jarring down is more than jarring up.
