How does a rotary screw compressor work?

Rotary Screw Compressors need a rather large supply of oil to keep the screws from turning bright red from friction heat. The separator is a large filter element that removes the oil from the output air that wasn't knocked free from the air when it rammed into the side of the receiver.

What is rotary screw air compressor oil?

Air compressor oil plays several vital roles within a rotary screw air compressor system: Rotary screw air compressors are sometimes "oil flooded" or "oil injected," describing that oil is injected into the rotor housing. The oil mixes with the air during compression but is separated back out before the compressed air leaves the system.

How does compressed air escape from a compressor?

Trapped air wants to escape. Meanwhile, the compressed air tries any way possible to escape the air compressor. One way is back to the screw element and out through the inlet filter. A part of the air/oil mixture will make it back past the check valve and/or the oil-stop valve. And there will be a good amount of oil in the screw element already.

What happens if a compressor runs unloaded?

When the compressor runs unloaded, it is still running, but it is not actively pumping air or building any pressure. The inlet valve is closed, so no 'fresh' air can be sucked in. The screw element is turning but not taking in any new air.

How does a rotary screw air compressor stop?

To explain what happens, let's first look at how things should normally work. A normal stop procedure for a rotary screw air compressor (without vomiting back the oil!) looks like this: 1) Compressor runs loaded 2) Compressor runs unloaded 3) Compressor Stops. New compressors will automatically first switch to 'unload' before completely stopping.

Why is my rotary screw compressor turning red?

Usually it's the oil separator in the receiver being saturated or in need of replacing that causes this. Don't run it that way for long or you will soon see an extremely large fire erupt. Rotary Screw Compressors need a rather large supply of oil to keep the screws from turning bright red from friction heat.
