

Zhiqi screw air compressor fault reset

Why does my compressor trip on over temperature?

If your compressor trips on over temperature, it could be any of the following: Ambient temperature too high or not enough ventilation. A screw compressor can run loaded ('pumping air') or unloaded ('idle'). The inlet/loading valve opens and closes according to air demand.

How do I Reset my air compressor?

To reset an air compressor, start by unplugging it and checking the power source for any issues. Next, locate the reset button, which is typically near the pressure switch or motor. Press the button to reset the compressor. If the compressor does not have a reset button, try turning it off and then back on again after a few minutes.

How do I adjust the pressure switch on an air compressor?

To adjust the pressure switch on an air compressor, start by identifying the location of the switch, which is typically located near the compressor motor. Before making any adjustments, ensure that the compressor is turned off and unplugged to avoid any accidents.

What should I do if my air compressor is too low?

If the capacity of the air compressor is really too low, check the following: Check differential pressure over oil separator. Replace separator when necessary. Check and replace compressed air filters (if installed). Compressor does not unload. Check if pressure switch is correctly set and working.

Why is my air compressor not working?

The typical cause for all this is a shortage in the internal flow of processes in your air compressor that makes it work as you've come to expect.

When does an air compressor stop working?

Normally, once your air compressor's tank fully drains all the way to a level of pressure cut, your air compressor system would start and run normally until the tank's pressure reaches the cut setting, which is when the compressor would typically stop.
